

PRIONOIA

I was waiting on hold the other day to talk to my pharmacist and while I was on Hold the music was interrupted with an announcement about new COVID-19 vaccines and boosters that are available for the elderly and I thought to myself, here we are five years after the fact and we still have people who are interested in this poisonous snake oil?

5 years of all of the lies about its effectiveness and later reports of reactions to vaccines which included heart problems, blood clotting and turbo cancers.

Soon-Shiong, founder of ImmunityBio and owner of the Los Angeles Times, claims that the COVID-19 pandemic, and the very vaccines developed to fight it, may be contributing to a global surge in “terrifyingly aggressive” cancers. Shiong, the Los Angeles Times owner leveraged his decades of clinical and scientific experience to outline why he suspects an unprecedented cancer epidemic is unfolding.

There have been many reports of sudden deaths and this is 5 years after we are told that ten years after the vaccine distribution we could be seeing a trend in rare disorders because of the exposure to the poisons unreported by the vaccines.

Last year, we reported that perhaps it would be prudent to look into the possibility of COVID vaccines may have ingredients that could act as prions and that CJD could surface after a long incubation period.

We actually presumed that these prions and clot threats were part of the package that Peter Hotez used as a threat to the new Trump administration as a possible health threat on the nation,

Scientists, including figures like Dr. Kevin W. McCairn, have proposed that: The SARS-CoV-2 spike protein, especially as produced by mRNA vaccines, may act like a prion, meaning it could cause protein misfolding in the body.

This misfolding may trigger amyloid or fibrin structures that are abnormally stable, leading to resistant, fibrous clots (i.e., "calamari clots". These abnormal clots are sometimes said to mimic characteristics of prion diseases, like Creutzfeldt-Jakob disease which involve neurodegeneration via misfolded proteins.

According to mounting data, one of the more serious side effects of the COVID mRNA jabs appears to be dementia, and worse yet, this previously untransmissible disease may now be “contagious,” transmissible by way of prions.

The term “prion” derives from “proteinaceous infectious particle.” Prions are known to cause a variety of neurodegenerative diseases in animals and humans, such as Creutzfeldt-Jakob disease (CJD) in humans, bovine spongiform encephalopathy (BSE or “mad cow disease”) in cattle, and chronic wasting disease in deer and elk.

These diseases are collectively referred to as transmissible spongiform encephalopathies (TSEs). They’re characterized by long incubation periods, brain damage, the formation of holes in the brain giving it a sponge-like appearance, and failure to induce an inflammatory response.

In short, prions are infectious agents composed entirely of a protein material that can fold in multiple, structurally distinct ways, at least one of which is transmissible to other prion proteins, leading to a disease that is similar to viral infections but without nucleic acids.

Unlike bacteria, viruses, and fungi, which contain nucleic acids (DNA or RNA) that instruct their replication, prions propagate by transmitting their misfolded protein state to normal variants of the same protein.

According to the prion disease model, the infectious properties of prions are due to the ability of the abnormal protein to convert the normal version of the protein into the misfolded form, thereby setting off a chain reaction that progressively damages the nervous system.

Prions are remarkably resistant to conventional methods of sterilization and can survive extreme conditions that would normally destroy nucleic acids or other pathogens, which is part of why prion diseases are so difficult to treat.

A few days ago it was reported that Health officials in Hood River County Oregon say that two people have died from CJD -- the prion equivalent to Mad Cow disease.

County health officials say they’ve identified three cases of Creutzfeldt-Jakob disease in the last eight months. One was confirmed by autopsy, while two are presumptive diagnoses.

Creutzfeldt-Jakob is caused by infectious prions, which causes rapid, progressive dementia, movement disorders and behavioral changes. It is considered incurable and universally fatal. There are about 350 cases per year in the United States, according to the National Institutes of Health.

There's no evidence the disease can be spread from person to person except through organ or tissue transplants or other unusual exposure to contaminated tissue.

According to the Centers for Disease Control, about 85% of all cases of Creutzfeldt-Jakob disease are considered sporadic, meaning there's no clear cause.

But the coincidence here is that we gave fair warning after the COVID-19 scare was nearly over that one should use caution when making decisions about COVID-19 vaccines and the risk they take in exposing themselves to prion contamination.

It was reported that researchers reported that the replacing of uracil with synthetic methylpseudouridine in the COVID shots — a process known as codon optimization can cause frameshifting, a glitch in the decoding, thereby triggering the production of off-target aberrant proteins.

The antibodies that develop as a result may, in turn, trigger off-target immune reactions.

According to British neuroscientist Dr. Kevin McCairn, this frameshifting phenomenon has also been linked to harmful prion production and that frame shifted prions, specifically, are infectious and can be transmitted from one person to another. As reported in the Journal of Theoretical Biology in 2013.

According the McCarin:

“A quantitatively consistent explanation for the titres of infectivity found in a variety of prion-containing preparations is provided on the basis that the etiological agents of transmissible spongiform encephalopathy comprise a very small population fraction of prion protein (PrP) variants, which contain frameshifted elements in their N-terminal octapeptide-repeat regions...”

Frameshifting accounts quantitatively for the etiology of prion disease. One per million frameshifted prions may be enough to cause disease. The HIV TAR-like element in the PRNP mRNA is likely an effector of frameshifting.

McCairn explained this mechanism thoroughly on Ground Zero:

“Mis-folded proteins caused by prions can impact every level organ and tissue system in the body ... [They] bioaccumulate and are resistant to degradation, thereby building up ...”

Prions may in fact be the primary molecule that is being “shed” by COVID jab recipients, and if those prions are due to frameshifting, that could be very bad news indeed, considering their implication in dementia.

If you frameshift over the stop codons, you're going to be making proteins that are spike-mito proteins.

The largest study to date on the side effects of the COVID jabs was published in the journal, *Vaccine* in February 12, 2024, and it confirms what I and many other alternative news sources have been saying all along, namely that the mRNA jabs are the most dangerous medical products to ever hit the market.

The study, performed by the Global COVID Vaccine Safety (GCoVS) Project and funded by the U.S. Centers for Disease Control and Prevention, Public Health Ontario and the Canadian Health Research Institute — evaluated the risk of “adverse events of special interest” (AESI) following COVID-19 “vaccination.”

Data from 10 sites in eight countries (Argentina, Australia, Canada, Denmark, Finland, France, New Zealand and Scotland) were included, encompassing more than 99 million vaccinated individuals.

Of the thousands of side effects Pfizer listed in its confidential report of post-authorization adverse events submitted to the U.S. Food and Drug Administration,¹⁴ the GCoVS focused on 13 AESIs that fall into three primary categories: Neurological, (triggering dementia and prions) hematologic (blood-related) and cardiovascular conditions.

The analysis revealed several concerning side effects, including increased risks of myocarditis, pericarditis, blood clots in the brain, and various neurological conditions.

Based on data from across the world, it's beyond clear that the COVID shots are the most dangerous drugs ever deployed. If you already got one or more COVID jabs and are now reconsidering, you'd be wise to avoid all vaccines from here on, as you need to end the assault on your body. Even if you haven't experienced any obvious side effects, your health may still be impacted long-term, so don't take any more shots.

If you're suffering from side effects, your first order of business is to eliminate the spike protein — and/or any aberrant off-target protein — that your body is producing. Two remedies shown to bind to and facilitate the removal of SARS-CoV-2 spike protein are hydroxychloroquine and ivermectin.

We can now understand, thanks to COVID vaccine scientists who recently blew the whistle, that a higher-than-usual blood clot risk exists for these cases of inflammation of the heart, as it's over-worked to push blood past all these “road blocks” of proteins, prions and disease-mimicking fragments floating around in the blood channels, sticking to inner walls of vessels, causing damage and severe inflammation.

COVID-19 mRNA vaccines instruct your cells to produce unlimited proteins and prions that clog the blood and cause heart inflammation.

There's a combination of inflammation and coagulation occurring in the vessels that triggers venous thromboembolism (VTE). This is why all the COVID-19 vaccine

manufacturers skipped clinical trials and got “emergency use authorization” for the shots, because they are considered by the FDA and CDC as “medical experiments,” and this is still going on right now. It’s one huge medical experiment that causes blood clots, heart inflammation and death.

Doctors meanwhile are concerned that a rare brain disorder is now popping up everywhere and how it is not behaving like it used to.

What a mystery, huh? Couldn’t be the untested, unsafe, prion-creating China Flu jabs, now could it? No person or entity is ever allowed to even ask that question in America.

Five years on we are now seeing signs of the future and while there will be very little reporting of these glitches the patterns must be analyzed and reported for their connections to the vaccines.

Your blood, if you’ve been COVID-19 mRNA inoculated, is now slowly clogging and coagulation to try to “defend” itself from the proteins your own cells are now creating – ones that mimic deadly virus strains . Your blood that flows past these clots can also add to the clot, making the clots bigger and more dangerous, compounding the coagulation factor. Then inflammation increases and the chance of a heart attack skyrockets.

Have you noticed that there have been health PSA's being played during late night radio warning people about the dangers of thrombosis or throwing a clot?

This is the answer to the “mystery” of why perfectly healthy young adults, all around the world, suffer heart inflammation within days of being Covid-19 ‘vaccinated’. Even the protein payload in the non-mRNA vaccines can cause inflammation and clotting, so none of the “vaxxers” are safe.

Of course, the heart is inflamed if major veins are clogged up with virus-mimicking proteins that stick together and to the inner walls of the blood vessels. Of course the entire human body is suffering from massive inflammation when the immune system recognizes it’s under CONSTANT attack by an army of mutated virus-looking fragments.

Prions however are terrifying as there is no way to stop them -- once they have started their mission turn the human brain to sponge.

Corruption of research is a widespread phenomenon currently found in many major, supposedly contagious health problems, ranging from AIDS to Hepatitis C, Bovine spongiform encephalopathy (BSE or “mad cow disease”), SARS, Avian flu and current vaccination practices (human papillomavirus or HPV vaccination).

In research on all of these six distinct public health concerns scientific research on viruses (or prions in the case of BSE) slipped onto the wrong track following basically

the same systematic pathway. This pathway always includes several key steps: inventing the risk of a disastrous epidemic, incriminating an elusive pathogen, ignoring alternative toxic causes, manipulating epidemiology with non-verifiable numbers to maximize the false perception of an imminent catastrophe, and promising salvation with vaccines.

This guarantees large financial returns. But how is it possible to achieve all of this? Simply by relying on the most powerful activator of human decision making process, FEAR!

And both the media and the pharmaceutical industry carry most of the responsibility for amplifying fears, fears that happen, incidentally, to always ignite fantastically profitable business. Research hypotheses covering these areas of virus research are practically never scientifically verified with appropriate controls. Instead, they are established by “consensus.”

This is then rapidly reshaped into a dogma, efficiently perpetuated in a quasi-religious manner by the media, including ensuring that research funding is restricted to projects supporting the dogma, excluding research into alternative hypotheses.

While the practice of feeding cow parts to other cows, one of the main causes of mad cow disease has been banned on paper, cow blood “products”, feather meal, pig and fish protein, and chicken manure are all still fed to cows. Remember, unlike bacteria or viruses, heat does NOT kill the deadly prions which cause mad cow disease or CJD.

Vaccines of course get their name from the serum that is used from cows to create the vaccine itself.

Prion diseases occur after a normal prion protein, which is found on the surface of cells, becomes abnormal. It eventually forms a clump in the brain and causes brain damage, and this can lead to personality changes, memory impairment, and movement difficulties. Prion diseases are fatal.

Certain people do have a higher chance of having prion disease, including people who have a family history of the condition, or people who have been infected by contaminated medical equipment. Thoroughly cleaning medical equipment can prevent the disease.

Aside from dementia, symptoms include changes in gait and difficulty walking, hallucinations, confusion, muscle stiffness, fatigue, and difficulty speaking. There's no cure for prion disease, though certain medicines can be taken to slow the progression of the illness.

Treatment is focused on keeping patients comfortable as their disease progresses.

People who develop prion disease usually require help from a caretaker after the fact; they may be able to live on their own for a time, but they'll eventually need to move to a care facility.

Looks like COVID-19 was simply a place holder for the triggering of various other illnesses that when compounded with the biological component of a vaccine we get future diseases that are part of an Iatrogenic result.

A world-renowned virologist has warned that the devastating true impact of the mass COVID mRNA vaccination campaign has yet to play out.

Dr. Geert Vanden Bossche, a former senior vaccine advisor at the Bill and Melinda Gates Foundation, is warning that "vaccinated people" are facing a wave of deadly disease.

However, there is also another possible vector of prions and that is in the food we eat, especially with meat and dairy. These particular food groups are under fire for how they contribute to green house gas emissions and are also being discouraged from the diet.

The conspiracy against food and forced scarcity is a problem as waiting for our consumption are various lab meats and GMO crops that I am sure will be encouraged , if a prion outbreak is shown to evolve into a pandemic.

Doctors have noticed some very rapid changes in the nutritional value as manufacturers are cutting corners to keep costs down during rapid inflation and in the process are sacrificing health and creating an environment that is reacting to the fad of taking a pill for everything and getting vaccinated for a sneeze.

How convenient would it be for meat and eggs to be restricted from the diet because of fears it may trigger a prion reaction in the brain.

During the first Mad Cow scare there were a lot of people that became overnight vegetarians as the USDA and FDA issued warnings about consuming tainted beef which would expose you to a prion that could incubate in your body and then suddenly turn your brain into mush.

As prions accumulate in the brain, plaque deposits may appear in the brain. Abnormal build-ups of proteins in and around neurons is thought to be what causes Alzheimer's.

Alzheimer's was previously believed to come in two forms — a 'sporadic' variant suffered by thousands of people over the age of 65, which is by far the most common, and a genetic early-onset type that runs in families.

The UCL scientists say they have now identified a third variant, which is slightly different from the others and very rare, which can be passed from one person to another.

This is how Frankenstein science can backfire, and the neglect of identifying toxicity can lead to debilitating illnesses. The hidden killers that lie in our toxic environment.
